# Overview

# Pulse Shape Discrimination (PSD)

LAr scintillates with a prompt and slow component:

identify and reject electronic backgrounds

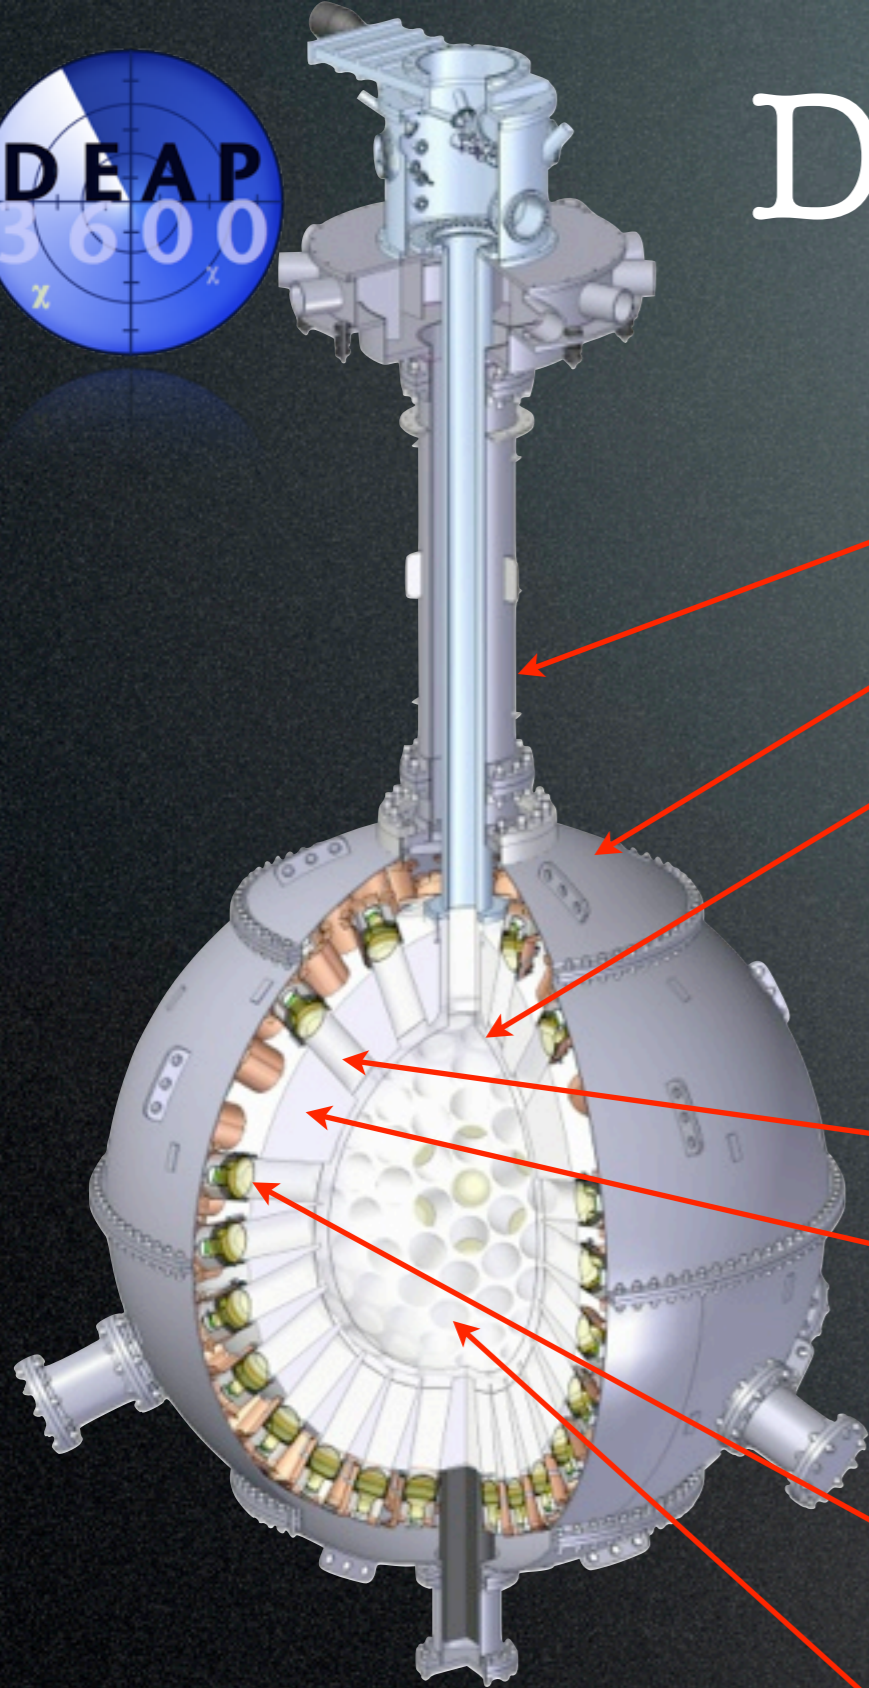

**Important for LAr:  $^{39}\text{Ar}$  beta (1 Bq/kg)** McKinsey & Coakley, Astropart. Phys. 22, 355 (2005)  
 Boulay and Hime, Astropart. Phys. 25, 179 (2006)  
 Lippincott et al., Phys.Rev.C 78:035801 (2008)

**Achieved  $e^-$  leakage  $< 3 \times 10^{-8}$  in 120-240 photo-electron window (Jillings, CAP '11)**  
**Expected  $< 1 \times 10^{-10}$  for DEAP-3600 for the same PE window**

Single-phase LAr detectors possible  
 because of rejection power from timing,  
 potential for kT scale detectors.

Overview of the timeline for  
DEAP-3600

# Summary

## DEAP-3600 in context

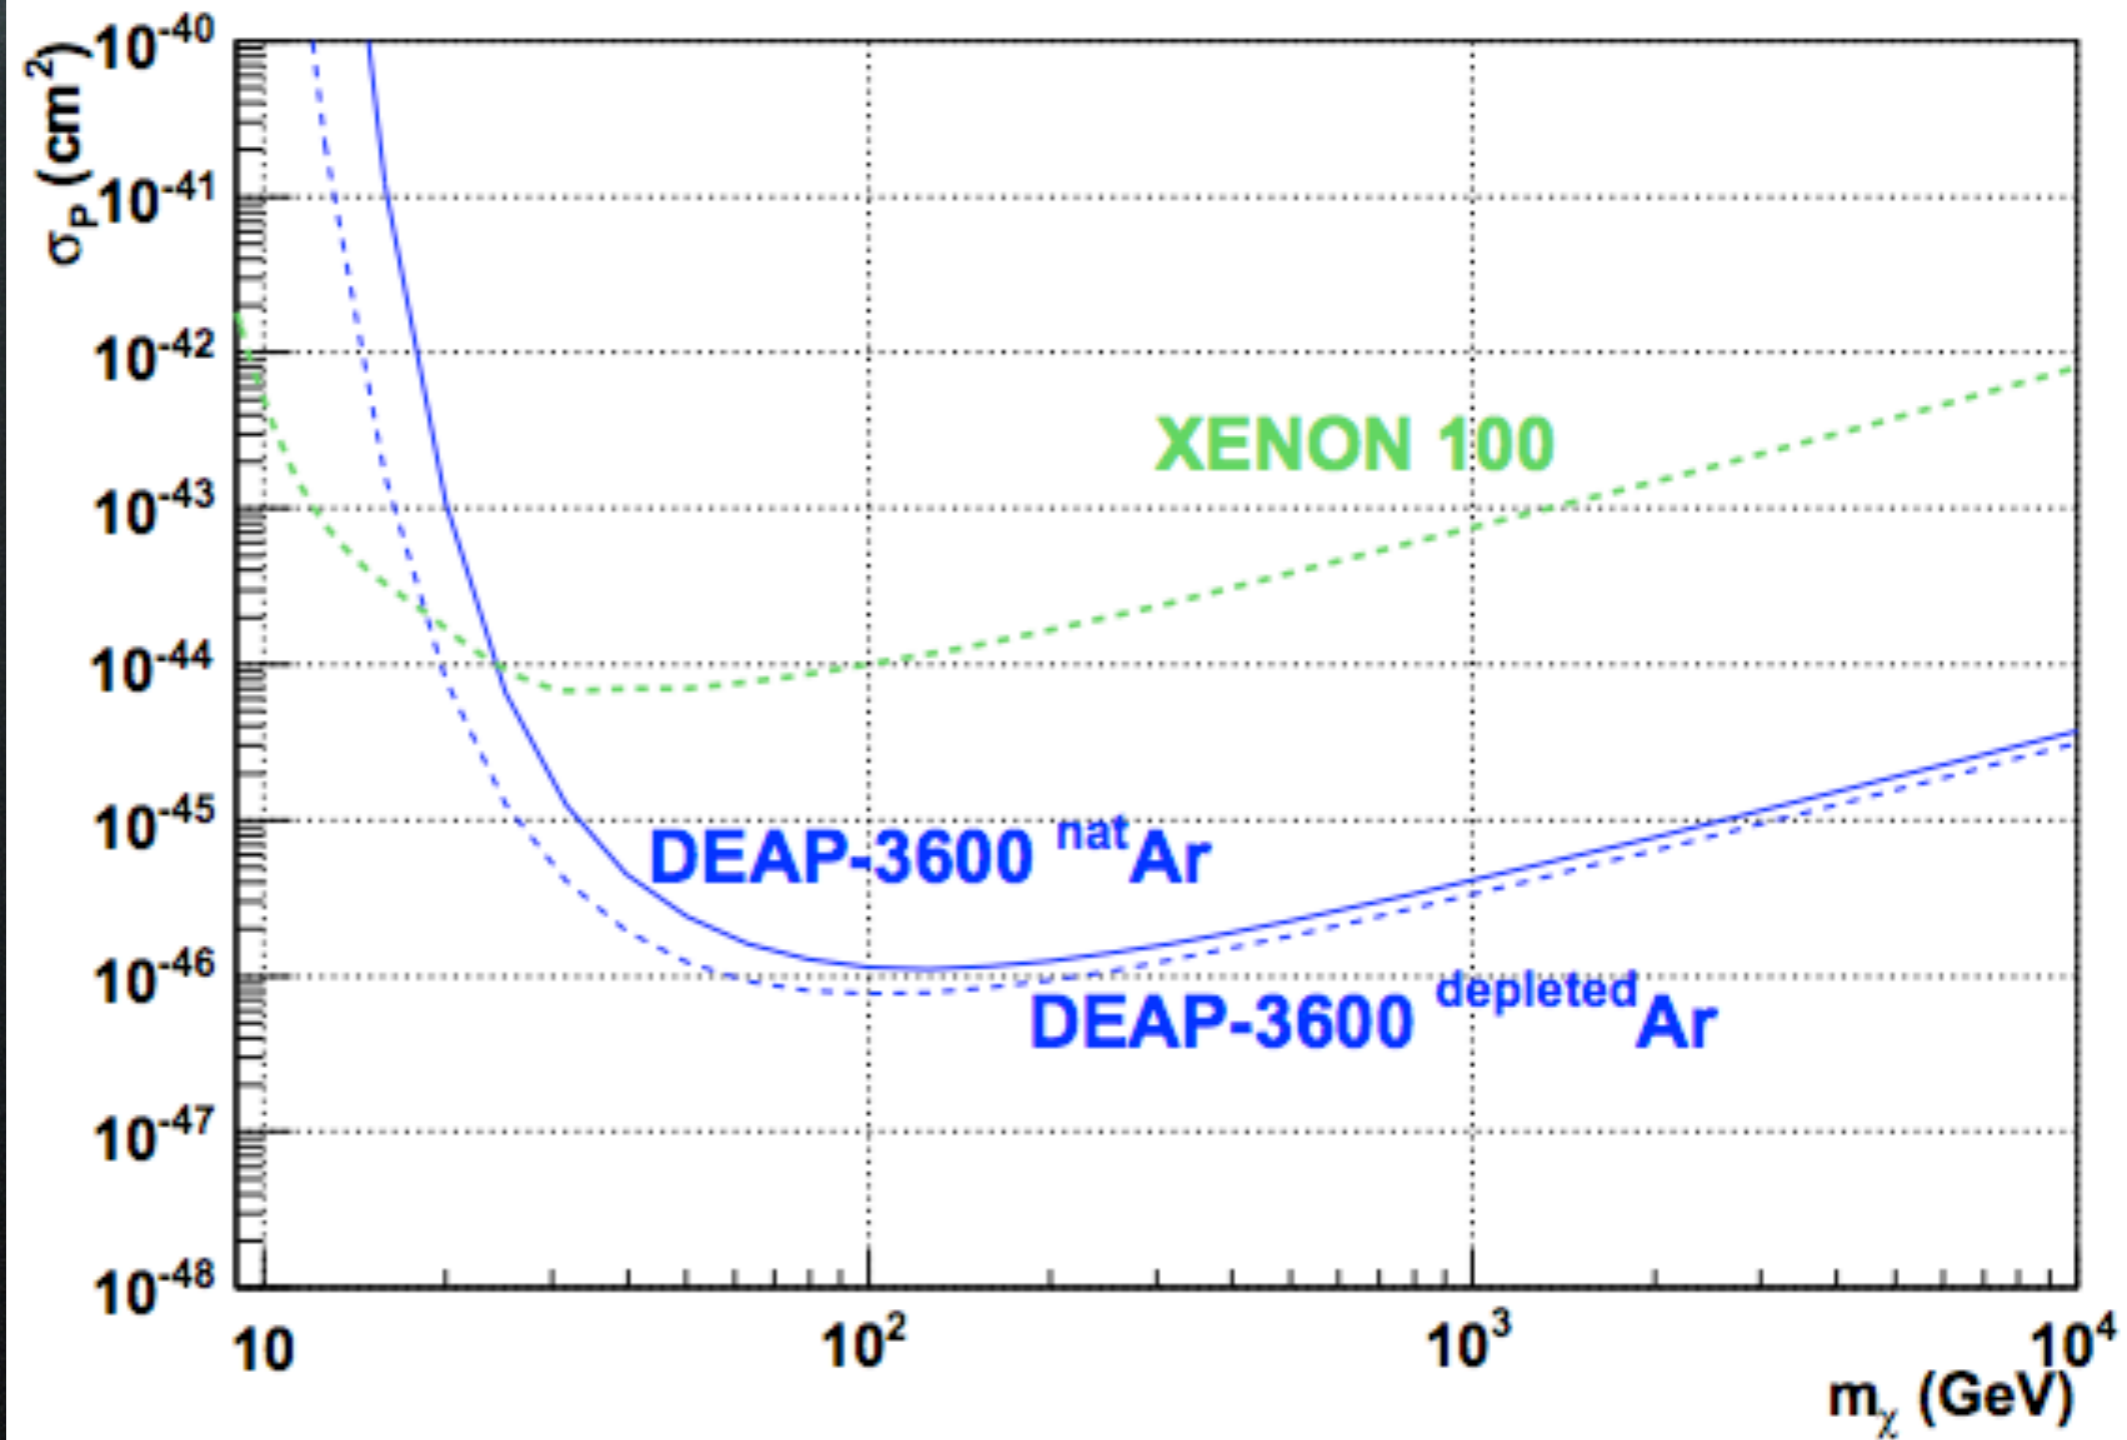

# Conclusions

- Single-phase LAr has a unique potential for direct detection of dark matter
- DEAP-3600 is well-positioned for leading sensitivity with a very good discovery potential
- Main detector components have been purchased, are being machined and construction is about to start
- Expect data taking to start in end of 2013

**Stay tuned!**

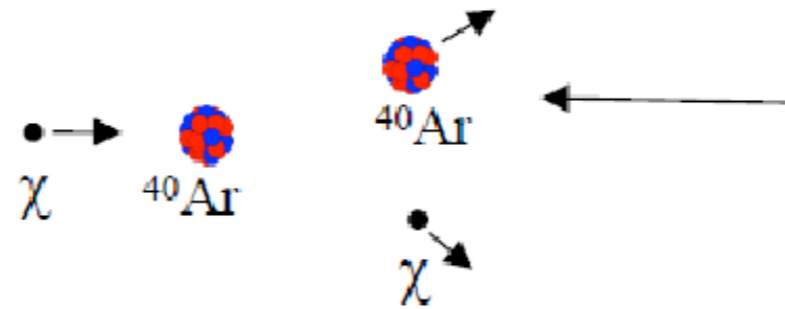

Thank you for your  
attention!

## Direct WIMP detection with liquid argon

Scattered nucleus (with several 10's of keV) is detected via scintillation in liquid argon.

Pulse-shape discrimination (PSD) is very powerful in argon, allows for suppression of background  $\beta/\gamma$  events.

Projected pulse shape discrimination (PSD) in argon allows threshold of approx. 20 keV<sub>ee</sub> (60 keV<sub>r</sub>)

1000 kg argon target allows 10<sup>-46</sup> cm<sup>2</sup> sensitivity (spin-independent) with ~20 keV<sub>ee</sub> threshold (~65 keV<sub>r</sub>) threshold, sufficient to mitigate <sup>39</sup>Ar

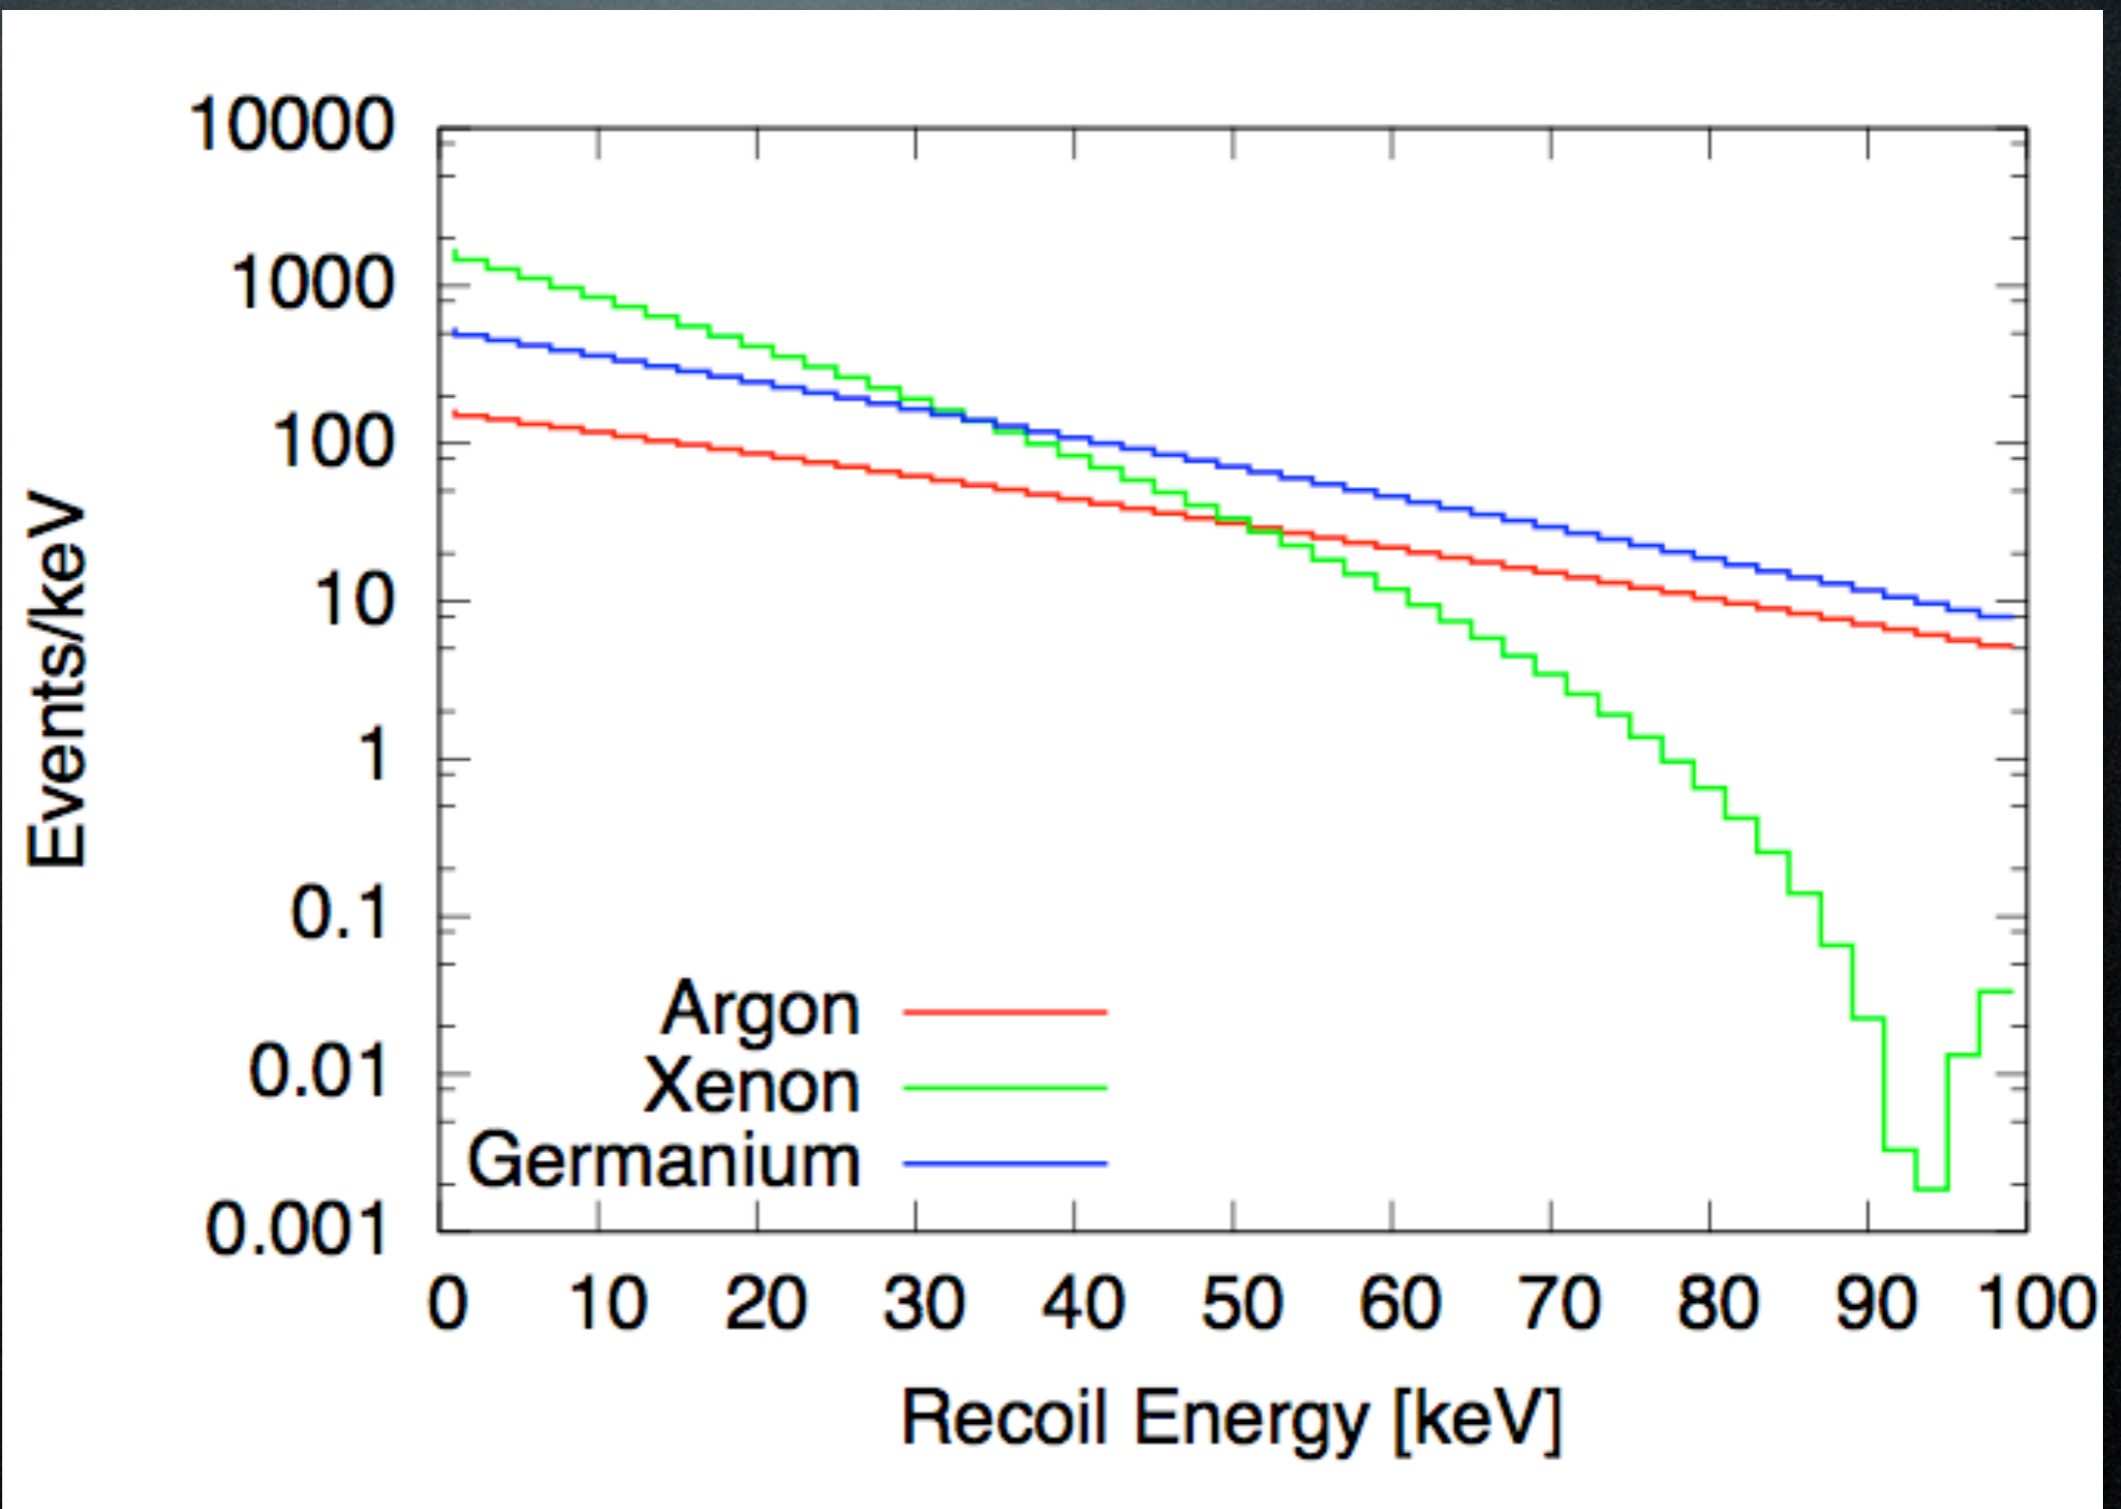

### Liquid argon

- is easily purified and has a high light yield
- is well-understood, allows for very simple scintillation detector
- has an easily accessible temperature (85K)
- allows a very large detector mass (~tonne) with uniform response (few % light yield uniformity)

DEAP-1 (7 kg)  
DEAP-3600 (3600 kg)

PSD in LAr

Maximise light yield!

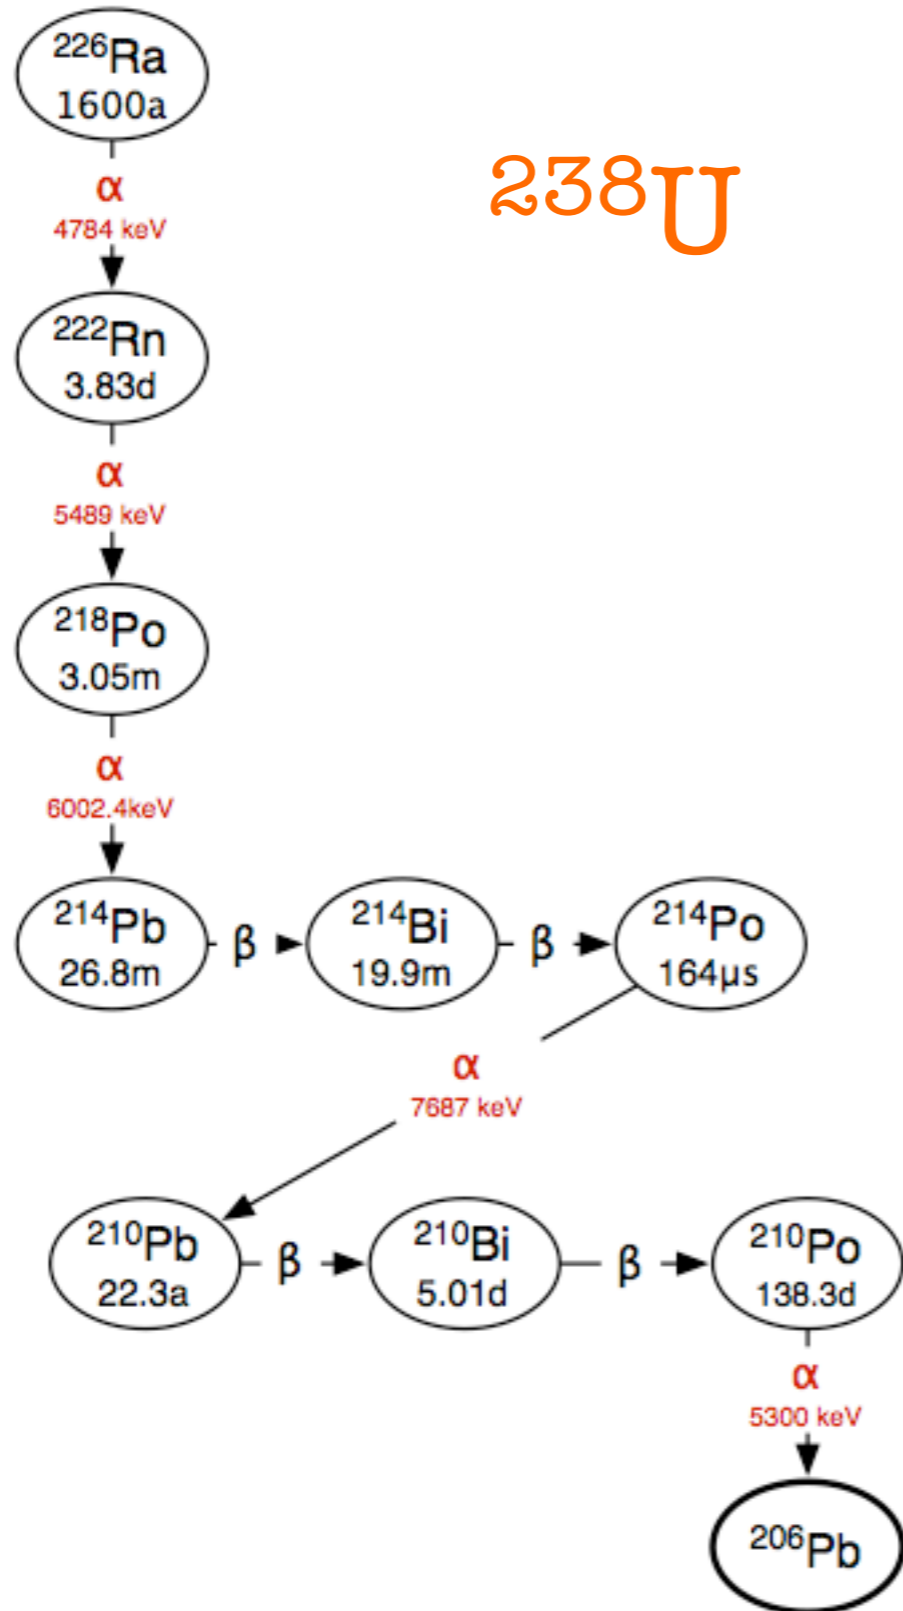

## PSD in DEAP-3600

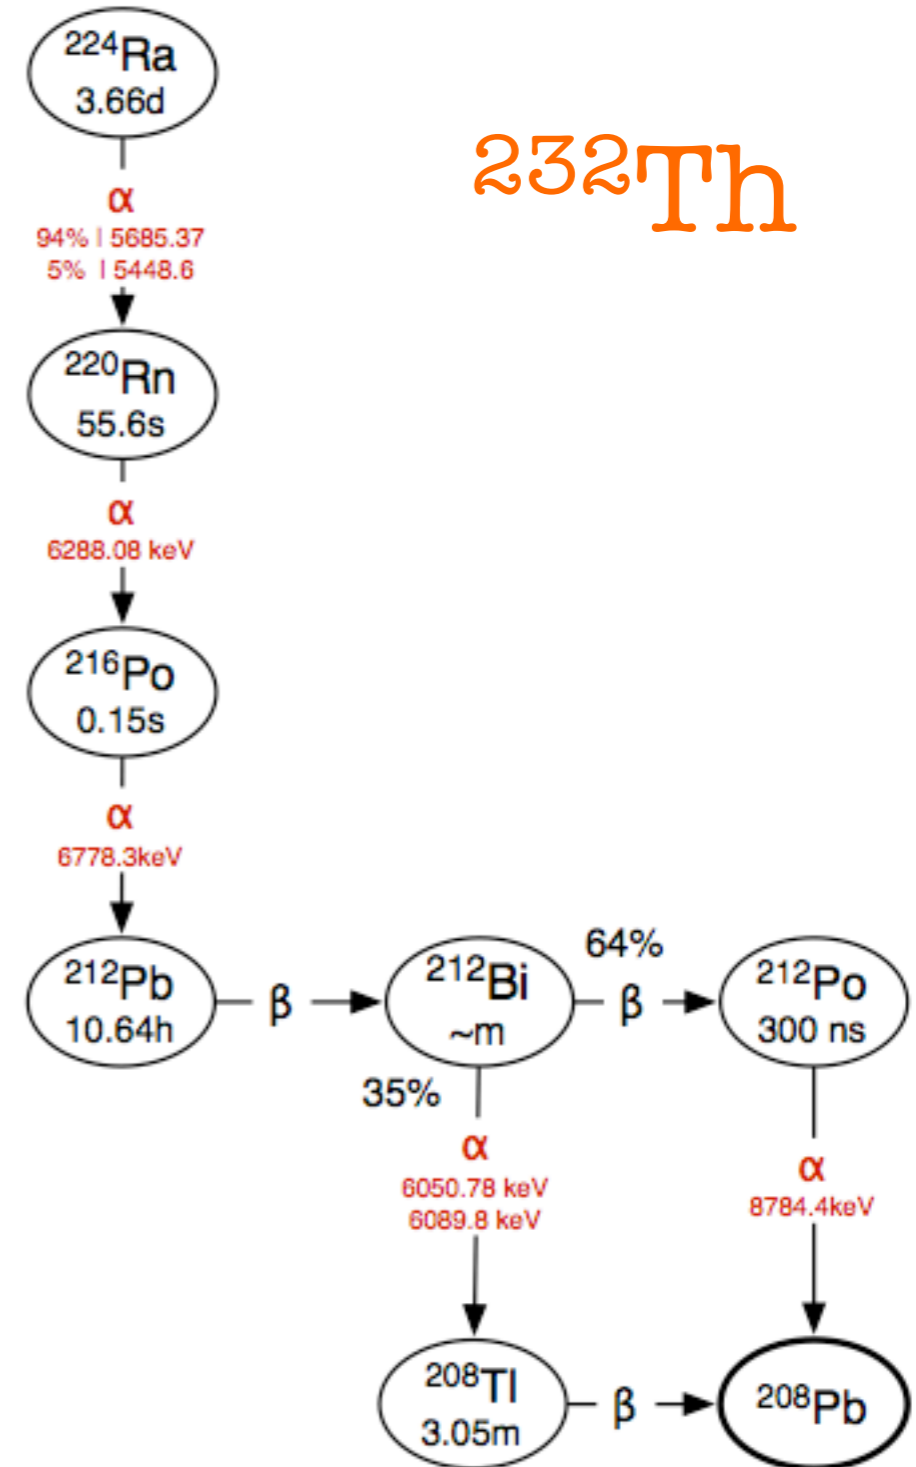

Results from the DEAP-1 7-kg liquid argon prototype detector at SNOLAB. (Left) Neutrons (high- $F_{\text{prompt}}$  band) and  $\gamma$ 's (low- $F_{\text{prompt}}$  band) from an untagged AmBe source. The boxes show  $F_{\text{prompt}}$  regions with 90% detection efficiency, with DEAP-3600 and DEAP-1 thresholds. (Right) Backgrounds in the DEAP-1 prototype. The low-energy “wall” is from  $\gamma$  backgrounds that are not removed by PSD; high-energy events are from radon and surface contamination. In the energy region from 25 to 40 keVee, the backgrounds correspond to approximately  $100 \mu\text{Bq}/\text{m}^2$ .
